Expected profit and CVaR by risk-aversion weight
Generic Industrial, hourly settlement, 20 MW/60 MWh battery
Expected profit
CVaR: mean of worst eight scenarios
(a) Merchant operation
(b) Low price: $\lambda^{PPA} = 40$, $c^{PPA} = 120$
(c) Benchmark: $\lambda^{PPA} = 80$, $c^{PPA} = 160$
(d) High contract: $\lambda^{PPA} = 100$, $c^{PPA} = 120$
Annual profit [MEUR/year]
Risk-aversion weight, $\beta$
